Goal

- Accurate modeling and simulation of seismo-acoustic waves through **heterogeneous domains with complex geometries**

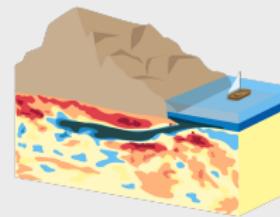

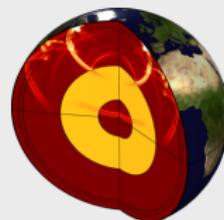

Fig. 1: Global seismic wave propagation

Fig. 2: Local heterogeneities of the Earth

- Minimize numerical dispersion and dissipation for long time propagation

Commonly used numerical tools

- Spectral Element Method (cG) / Finite Differences (FDTD)
- **Main issue:** Complex mesh generation for realistic geological structures

cG vs. dG methods

Main advantages of dG methods

- **Mesh flexibility:** Handling of unstructured / polyhedral meshes
- **Local conservativity at the element level**
- **Same order of convergence as cG for smooth solutions:**
 - ▶ H^1 -error: $\mathcal{O}(h^k)$
 - ▶ L^2 -error: $\mathcal{O}(h^{k+1})$

Drawbacks of dG methods

- **Higher computational cost and memory requirement**

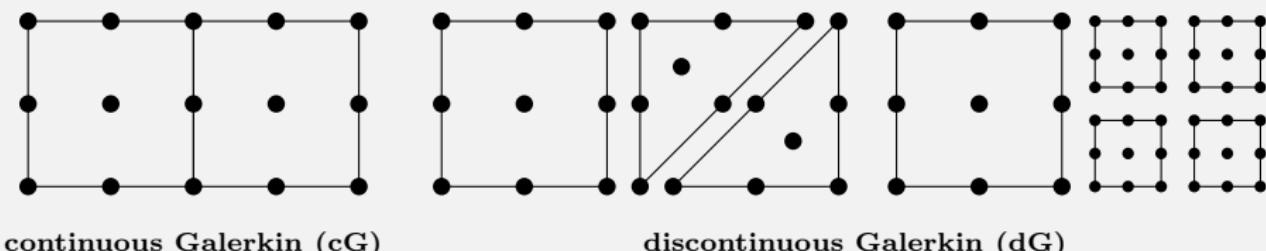

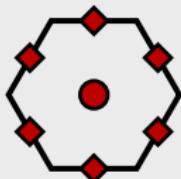

Fig. 3: Discrete unknowns for cG and dG methods

Introduction to HHO methods

- Seminal papers: [Di Pietro, Ern, and Lemaire, 2014], [Di Pietro and Ern, 2015]

Degrees of freedom

- Polynomial unknowns attached to mesh cells and faces

HHO unknowns:
 $\hat{u}_h := (u_\tau, u_\mathcal{F}) \in \hat{\mathcal{U}}_h$

- Cell unknowns, degree $k' \in \{k, k + 1\}$
- ◆ Face unknowns, degree $k \geq 0$

Fig. 4: Local HHO unknowns. **Left:** $k' = k = 0$. **Right:** $k' = k + 1 = 1$.

- ▶ Equal-order: $k' = k$
- ▶ Mixed-order: $k' = k + 1$

Design

■ Gradient reconstruction operator:

$$(\nabla \mathbf{u})_{|T} \rightarrow \mathbf{G}_T(\hat{\mathbf{u}}_T) \in \mathbb{P}^k(T; \mathbb{R}^d)$$

Design of $\mathbf{G}_T(\hat{\mathbf{u}}_T)$ mimics an integration by parts

■ Stabilization operator: $\boldsymbol{\delta}_{\partial T}(\hat{\mathbf{u}}_T) := \mathbf{u}_{\partial T} - \mathbf{u}_{T|\partial T} \approx \mathbf{0}$

Matching of cell dofs trace with face dofs (weakly)

Advantages of HHO over dG methods

■ Improved error estimates for smooth solutions

- ▶ H^1 -error: $\mathcal{O}(h^{k+1})$
- ▶ L^2 -error: $\mathcal{O}(h^{k+2})$

■ Attractive computational costs

Elimination of cell unknowns by **static condensation**

- ▶ Global problem couples only face dofs
- ▶ Cell dofs recovered by local post-processing
